Brussels, 18 MARS 2010
ENTR/D/4/CA/cm D(2010) 8861

Mrs E. Santiago
CEN/ CENELEC Director General
Av Marnix 17
B-1050 Brussels

Subject: 2010-2013 ICT Standardisation Work Programme

Dear Mrs Santiago,

Please find attached the final version of the 2010-2013 ICT Standardisation Work Programme which follows on from last year's exercise.

The Work Programme identifies 13 specific priority domains, while domain 14 covers support for implementation issues.

The 2010-2013 Work Programme is the result of a broad consultation of Commission services. The priorities were selected from the numerous domains that are addressed by the relevant Community legislation and policies.

Please note that the Work Programme mentioned in reference is a rolling programme covering the priorities for the next 3 years. Updates of the Work Programme can be issued to match possible policy changes in the future. Although the Work Programme is a rolling programme as regards content, the budget for standardisation activities is still fixed on an annual basis. Subsequently, and as agreed at the kick-off meeting of 24 February 2010, CEN, CENELEC and ETSI are now formally invited to submit detailed proposals for standardisation activities which may be funded by the Commission under the 2010 standardisation budget.

The proposals should respond to the priorities set by the Work Programme and should be submitted to my unit by **17 May 2010** at the latest.

The Commission services will evaluate each proposal over the coming weeks. As in previous years standardisation organisations may be invited to assist at the evaluation process on an external basis, i.e to answer on-the-spot questions and any requests for clarification which may be raised by the evaluation committees.

As we aim to conclude the evaluation exercise by the end of July 2010 and the corresponding contracts by the end of the year, we would appreciate your rapid response in this matter.

Please do not hesitate to contact us should you need any further clarification on the subject.

Best regards

Costas Andropoulos

Innovation policy
ICT for Competitiveness and Innovation

2010-2013 ICT Standardisation Work Programme

18/3/2010

Introduction to the 2010-2013 ICT standardisation work programme

ICT standardisation is part of the general standardisation activities and contributes to the policy objective of improving European competitiveness while balancing industry expectations with societal needs.

Public authorities are interested in complementing European legislation and policies by references to standards. Standards established by the private sector can help create a level playing field for competition and their referencing can be a means of promoting an effective partnership between the private and public sectors. With its Communication on “The role of European standardisation in the framework of European policies and legislation” [COM (2004)647], the Commission aims to further broaden the use of such references.

The legal basis for the European standardisation policy, Directive 98/34, complemented by Council Decision 87/95 focusing on the specificities of the ICT domain, allows the European Commission to contribute financially to standard setting by the recognised European Standardisation Organisations, CEN, CENELEC and ETSI. Both the general standardisation policy and the ICT standardisation policy are currently undergoing a revision process.

The current European ICT standardisation policy is being reviewed. A White Paper: Modernising the ICT standardisation policy in the EU- The Way Forward-sets proposals for policy choices and specific measures that would help the European ICT standardisation to better respond to industry and societal needs. The proposals brought forward by the White Paper have been broadly accepted as demonstrated by the public consultation held in summer 2009. The report on the public consultation is available on http://ec.europa.eu/enterprise/sectors/ict/files/overview_report_results_consultation_en.pdf.

The main objective for the EU ICT standardisation policy is to promote the use of standards as a means to increase interoperability between services and applications. Given the global nature of the market, synergy and cooperation between the ESOs and relevant fora and consortia is encouraged to cope with the ever-growing demand for standards to support interoperability in this fast evolving and innovative technology domain.

With this 3-year, rolling ICT standardisation work programme, the Commission services are inviting the ESOs, where appropriate in cooperation with relevant fora and consortia, to initiate standardisation activities as well as activities supporting the implementation of standards such as interoperability testing, promotional activities, educational initiatives, etc. in the specified policy domains. The policy domains result from legislation or policy initiatives which need standards for effective implementation.

This ICT standardisation work programme is the result of intensive inter-service cooperation complemented by consultation with the ESOs. These processes led to the identification of areas of high political importance that could benefit from the referencing of standards to help achieve policy objectives. The work programme provides the potential to cover ICT standardisation needs over a 3 years period and each standardisation request clearly indicates which type of standardisation deliverable is needed and the corresponding time frame.

The work programme is intended to be a living document which can be adjusted or updated if deemed necessary. A first evaluation of the effectiveness of the multi-annual work

programme for ICT standardisation will be made in early 2011 at which time a decision can be made on whether to continue with the multi-annual approach.

Scope of the 2010-2013 ICT standardisation work programme

Further to the consultation of relevant Commission services, the 2010-2013 ICT standardisation work programme covers following priority domains:

- Domain 1a: eHealth
- Domain 1b: Standardisation in the field of regulated medicinal products
- Domain 2: eInclusion
- Domain 3: Intelligent transport
- Domain 4: RFID
- Domain 5: Electronic signatures
- Domain 6: eInvoicing
- Domain 7: eSkills and eLearning
- Domain 8: ICT for sustainable growth
- Domain 9: Internet of things
- Domain 10: ePublishing
- Domain 11: eSecurity
- Domain 12: eBusiness
- Domain 13: eGovernment
- Domain 14: Support to standards implementation

Domain 1a: eHealth

EU policy area: eHealth
<p>eHealth is one of the fastest developing areas for ICT applications. At the same time a number of obstacles are impeding the exploitation of new products and services for the benefit of patients and for Europe's economy. Data protection issues and the lack of interoperability are two of the main obstacles.</p> <p>To foster telemedicine applications the Commission has published a Communication in 2008 which calls for actions in the area of technical issues and related to the functioning of the Internal Market. Although some telemedicine services have existed for a long time and most of the ICT has been in place for a while, there are still areas where technical and infrastructural issues need to be addressed. For example, broadband connectivity in all geographical areas in the EU, including rural and ultra-peripheral regions, is a precondition for telemedicine deployment and for universal access of all individuals to healthcare.</p> <p>Interoperability and in particular cross—border interoperability is crucial to allow a widespread use of ICT in the health sector, enabling the creation of a single market in this area. The use of existing standards and the development of new ones as well as standardised approaches to achieve interoperability should be supported by standards development organisations, with the active participation of industry. Coordinated community action is necessary, and indeed has been explicitly called for in the draft Directive on patients' rights in cross-border healthcare.</p>
Justification for the standardisation activities
<p>The development of standards allowing interoperability of eHealth applications is crucial. This must go hand in hand with appropriate interoperability testing activities. Since eHealth is a relatively new area there is a considerable need for new standards and interoperability tests.</p> <p>Furthermore, market fragmentation and thus a non-functioning of the Internal Market in eHealth is aggravated by the lack of technical and semantic interoperability.</p>
Reference documents
<ul style="list-style-type: none">• COM(2004) 356: Communication from the Commission to the Council, the European Parliament, the European Economic and Social Committee and the Committee of the Regions -e-Health- making healthcare better for European citizens: an action plan for a European e-Health Area• COM(2008) 689: Communication to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions on telemedicine for the benefit of patients, healthcare systems and society• COM(2008) 414: Proposal for a Directive of the European Parliament and of the Council on the application of patients' rights in cross-border healthcare• COM Recommendation C(2008) 3282 of 2 July 2008 on cross-border interoperability of electronic health record systems

- DG INFSO Semantic Health Report – January 2009
- Mandate 403 to CEN, CENELEC and ETSI on eHealth Interoperability

Required standardisation actions

The execution of Phase II of the eHealth mandate M 403 is one of the key standardisation activities. Since the mandate does not cover the proper interoperability testing, it must be complemented by appropriate standardisation activities for interoperability testing and certification.

As Semantic Interoperability is a prerequisite for further standardisation activities special emphasis need to be put on semantic interoperability standardization.

The deliveries will be Workshop Agreements.

The time frame for the required standardisation deliverables

Once the work on Phase II of M 403 started the testing activities could start with a delay of one year. In general a period of three years for these activities should be envisaged.

Involved Commission services

Lead Service: DG INFSO H1

Contact Person: DG ENTR D4 Martina Sindelar

Domain 1b: Standardisation in the field of regulated medicinal products

EU policy area: Standardisation in the field of regulated medicinal products

European health policy seeks to protect people from health threats and disease, promote healthy lifestyles and support cooperation across the Community on health issues. In support of the first of these, availability and interoperability of good quality data and information is key.

Through submission of information to regulatory authorities, and consequent regulatory activity in connection with such information, it is planned to compile and make available to other stakeholders information that is of good quality and standardised. Standardisation in this connection concerns the structures in which such information is held, the types of information expected throughout such structures, and the standardised terminologies used in compiling such information.

The availability of internationally available, regulated information in a recognised standard format will serve as a sound platform for pharmacovigilance activities in the regulatory environment and for the development of extended databases of information in the healthcare domain as a whole. The standards will constrain the initial submission of information by applicants and sponsors to regulatory authorities, the treatment of information through the regulatory processes, and the subsequent dissemination of regulated information in such a way as to enhance interoperability, not only within the regulatory domain, but also across healthcare domains.

Justification for the standardisation activities

In the context of the regulation of medicinal products, standardisation for the exchange of information between stakeholders enables regulatory, pharmacovigilance and healthcare activities, *inter alia*, to be undertaken with increased efficiency and certainty, thereby contributing to improved protection of public health.

Reference documents

ISO/DIS 27953-1: Health informatics -- Pharmacovigilance - Individual case safety report -- Part 1: The framework for adverse event reporting

ISO/DIS 27953-2: Health informatics -- Pharmacovigilance - Individual case safety report -- Part 2: Human pharmaceutical reporting requirements for ICSR

See TC 215 at http://www.iso.org/iso/iso_catalogue/catalogue_tc.htm

This list very likely can be completed with references pointing to policy and or implementation activities in various policy domains (internal market, taxation, environment, justice, liberty and security, etc.)

Required standardisation actions

- Work is required on the:
 - Finalisation of the Identification of Medicinal Products (IDMP) International Standards, including possible further development of product information structures for the ICSR
 - Support for Joint Initiative projects for the exchange of information in the domain of regulated medicinal products
 - Regulated Product Submissions (next major version of the electronic Common Technical Document)
 - Clinical Trial Registration and Results
 - Support for other international standardisation activities that may be proposed in any of the Standard development Organisations that are involved in the Joint Initiative during the period of this work programme.
 - Support for the standardisation of terminologies in the domain of regulated medicinal products; and
- *Are there particular areas (in specific policy domains) where the ESOs today can start supporting EU policy via standardisation (replacing the current practice of "standardisation via EU institutional committees")?*

The time frame for the required standardisation deliverables

No specific time table for the generic actions – but if we add specific actions, concrete time frames may be needed.

The timeframes are:

- Finalisation of IDMP with the ICSR: Phase 1 – December 2011
- Support for Joint Initiative projects for the exchange of information in the domain of regulated medicinal products
 - Regulated Product Submissions, Release 3 – March 2013
 - Clinical Trial Registration and Results: Phase 1 – December 2011
 - Support for other international standardisation activities that may be proposed in any of the Standard development Organisations that are involved in the Joint Initiative during the period of this work programme., including subsequent releases of the foregoing – December 2013

Support for the standardisation of terminologies in the domain of regulated medicinal products – December 2013.

Involved Commission services

Lead Service: SANCO C8

Contact Persons: European Medicines Agency Tim Buxton, DG ENTR D4 Martina Sindelar

Domain 2: eInclusion

EU policy area: e-Inclusion
<p>1.) e-Inclusion for people with disabilities</p> <p>The European Union approach to disability demands the elimination of discrimination and the determination that people with disabilities should have the same rights in daily life than non-disabled people</p> <p>The EU perceives disability essentially as the result of the dynamic interaction between a person with impairment and his or her environment. Generally it is the environment that is disabling rather than the nature of the impairment itself. Equal rights in society and economy cannot be realised without equal access to goods and services.</p> <p>Many goods and services including ICT related ones fall under internal market regulations in Europe. The Internal Market comprises an area without internal frontiers in which free movement of goods, services, persons and capital is ensured. (art 14 of the EC Treaty). Declaration 22 annexed to the final Act of the Amsterdam Treaty provides that the Institutions of the Community shall take account of the needs of persons with a disability in drawing up measures under Article 95 of the Treaty.</p>
<p>2.) e-Inclusion for Ageing</p> <p>The strong development towards an aging society all over Europe is a challenge offers also new opportunities for societal innovation, in particular through the use of appropriate ICT products and service which allows elderly people to actively participate in social life but includes also the aspect of independent living.</p>
<p>Justification for the standardisation activities</p> <p>Accessibility is at the core of the European Disability Action plan and the UN Convention on the Rights of Persons with Disabilities that was signed by the European Community and all Member States. Accessibility is one of the general principles (article 3) to be taken into account in the overall implementing of the Convention. Furthermore, article 9 of the UN Convention provides that State Parties shall take appropriate measures to develop, promulgate and monitor the implementation of minimum standards and guidelines for the accessibility of facilities and services open or provided to the public. Among the areas to be covered are information and communications, including information and communications technologies and systems.</p> <p>Under the General obligations of the Convention in article 4 there is the obligation to promote universal design¹ in the development of standards and guidelines.</p> <p>The Commission is currently preparing a new European Disability Strategy for 2010-</p>

¹ The UN Convention in its article 2 states that Definitions “Universal design” means the design of products, environments, programmes and services to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design. “Universal design” shall not exclude assistive devices for particular groups of persons with disabilities where this is needed. In fact Design for all should consider the interfaces with assistive devices.

2020 to succeed the current action plan. The Commission Proposal for a Council Directive on implementing the principle of equal treatment between persons irrespective of inter alia disability contains an article related to accessibility. Work on accessibility standards can complement this legislative proposal and help to facilitate its practical implementation.

Interoperability is a key objective to foster the take-up of accessible products and services by industry and end-users use. Standards are the key to ensure interoperability.

Reference documents

- COM(2008)0804 final Communication Towards an accessible information society
- EU Disability Action Plan (DAP) 2003-2010 (expected May 2010)
- Digital Agenda (not yet finalised)
- M 376 Standardisation Mandate to CEN, CENELEC and ETSI in support of European accessibility Requirements for Public Procurement of Products and Services in the ICT Domain
- M420 Standardisation Mandate to CEN, CENELEC and ETSI in support of European Accessibility Requirements for Public Procurement in the Build Environment

Required standardisation actions

Support is needed for the implementation of Mandates:

- M 376 (Phase II EN)
- M420 (Phase I work programme, Phase II EN)
- A new Standardisation Mandate to CEN CENELEC AND ETSI to include "Design for All" in relevant standardisation initiatives (Phase I work programme, Phase II EN)

New areas for standardisation activities (deliveries: Workshop Agreements or Technical Reports)

- Safety regarding assisting/companion robots in unstructured/uncontrolled environments (e.g. home or outside);

Interoperability of components for smart homes/independent living:

- At devices level

- At semantic level (ontologies)
- For exchange of contextual information between artefacts
- Accessibility ontologies for service oriented architectures (i.e. integrated accessibility solution rather than accessibility of separate components); User modelling of human functional limitations (motor, sensory, cognitive and mental); harmonised assessment of human functional limitations (motor, sensory, cognitive and mental) and of compensating assistance needed.
- Accessibility of self-service terminals and information
 - display/ announcement
 - Total conversation (including text telephony); Accessibility of emergency call systems and PA system.
 - Accessibility of digital maps and LBS/GIS solutions; Interoperability of BNCI devices.
 - Eye gaze assistive solutions, in relation to roadmap from now closed COGAIN Network of Excellence.
- Harmonised assessment of auditory profiles.
- Reduction of interaction complexity through harmonised symbols and terminology across manufacturers and service providers and minimum standards in user education
- Mainstreaming accessibility in the relevant standardisation work, for example in eHealth, eSkills and education, eProcurement, eSignatures and in other domains where interaction of persons with technology is addressed.
- Usability of the interaction of persons with technology
- User experience of the ICT products and services
- Standardized personalization utilizing user profiles is important for achieving usability for all people in a range of situations. Further work on personalization will be needed in a range of domains as well as for future services and devices.

The time frame for the required standardisation deliverables

The work will have to be done in the period covered with the new European Disability Strategy. However the execution of the ongoing Mandates needs to be finished place in the next two years and the adoption of the new mandate on “Design for All” is planned for 2010. For the new activities a period of 2-4 years should be envisaged.

Involved Commission services

Lead Services: DG EMPL G3, DG INFSO H3

Contact Person: DG ENTR D4 Martina Sindelar

Domain 3: Intelligent Transport

EU policy area: Intelligent Transport

Standardisation needs in the field of transport are particularly related to the i2010 Intelligent Car and eSafety and Green Car initiatives, Electronic Fee Collection and the Intelligent Transport System (ITS) Action Plan.

The intelligent car initiative will accelerate the deployment of intelligent vehicle systems ensuring interoperability across countries and harmonising technical solutions.

ICT based services and applications will bring down the number of road victims and reduce road traffic's energy consumption and CO₂ exhausts, contributing to low carbon mobility.

The ITS Action Plan complements the work of the Intelligent Car initiative and of the eSafety forum By addressing the priority areas where actions are necessary to lift the barriers hampering a wider and more coordinated deployment and use of ITS. The costs of traffic congestion – estimated at 1% of the European GDP – could be reduced by up to 10% through the deployment of ITS, which could also prevent more than 5000 deaths in road accidents.

International cooperation for the development of harmonised global standards is particularly important in these areas. An agreement with the US Department of Transport has been concluded regarding ICT applications to road transport.

Justification for the standardisation activities

The integration of various ITS applications within a coherent, open in-vehicle architecture could yield better efficiency and usability, reduced costs and enhanced extensibility.

EU activities aim at making available a common application to Transport authorities and private service providers around Europe in order to develop interoperability and avoid the necessity for citizens to get a different media to access Public Transport when they move out of their domestic fare management territory.

The field of cooperative systems is in a situation that prevents available technology from gaining critical market-share. In order to deploy all their possible benefits a sufficient market penetration of ITS applications is needed, and for that, the deployment of common standards is necessary

- COM(2009) 434 final: eCall, Time for Deployment
- COM(2008)887 final: Proposal of a Directive of the European Parliament and of the Council laying down the framework for the deployment of Intelligent Transport Systems in the field of road transport and for interfaces with other transport modes
- COM(2008)886 final: Communication from the Commission "Action Plan for the Deployment of Intelligent Transport Systems in Europe"
- COM(2008) 800 final: A European Economic Recovery Plan (Green Cars initiative)
- COM(2007)541: "Towards Europe-wide Safer, Cleaner and Efficient Mobility: The First Intelligent Car Report"
- COM(2006)59: The Intelligent Car Initiative - "Raising awareness of ICT for smarter, safer and cleaner vehicles".
- Recommendation C/2006/7125: Safe and efficient in-vehicle information and communication systems: update of the European statement of principles on human machine interface.
- Mandate M/338: Electronic Fee Collection
- Mandate M/453: Co-operative systems for Intelligent Transport in the field of information and communication technologies to support interoperability of co-operative systems for intelligent transport in the European Community

Required standardisation actions

- Electronic Fee Collection: The ESOs are invited to keep on submitting proposals included in the work programme responding to mandate M/338 that are still missing in order to support Directive 2004/52 and Decision 2009/750/EC. Security, privacy and data protection aspects should be taken into account. The following work items are of particular interest:
 1. Electronic fee collection – Security framework of the European Electronic Toll Service (EETS). This work item should define a technical specification which is part of the standards family developed in CEN TC278 WG1. This specification provides the necessary security elements which are needed to implement an interoperable EETS and to enable trust between all stakeholders. It should be based on the identification of the security assets to be protected, which also covers data privacy aspects. The security assets are information objects, interfaces, subsystems and other entities or

events which need to be protected.

2. Electronic fee collection - Charging performance metrics and examination framework for EETS. A technical specification is needed to provide the necessary elements and framework to define metrics and examination methodologies for consistent determination of tolls due in EETS and other EFC systems. Should be considered:
 - ① the definition of metrics for measuring charging performance in terms of the acceptable level of errors associated with charging computation (charging reliability);
 - ② the definition of examination methods to compute the identified metrics.
 3. Technical Specification on "Interoperable application profile for autonomous systems".
- Co-operative systems. The ESOs are invited to develop standards in order to ensure deployment and interoperability of co-operative systems and services as envisaged in the work programme responding to mandate M/453. This includes inter-vehicle communications (V2V), vehicle to infrastructure and infrastructure to vehicle communications (V2I/I2V) and infrastructure to infrastructure communications (I2I) and in particular those operating in the 5.9 GHz frequency band. Proposals should also include technical specifications and relevant technical reports on co-operative systems to meet the requirements specified in mandate M/453 including standards required for communication, information and security. Proposals for the development of test methods for assessing the conformity of the identified minimum set of standards in accordance with mandate M/453 should also be included in the proposals.
 - Emergency Communications: The ESOs are invited to keep on submitting proposals for standards taking into account the current status of the eCall initiative and the future evolution of the mobile communication networks and the IP environment, in particular IPv6 networks while taking into account privacy and data protection aspects. It will be in particular important completing the test suites specifications needed for certification procedures of the pan-European eCall service. The field is not limited to the eCall inside vehicles but to any emergency Call from any communications device, e.g., PSTN fixed phones and VoIP phones.
 - Digital Maps: The ESOs are invited to consider the need of producing standards and specifications for to the definition of procedures for ensuring the availability of accurate public data for digital maps and their timely updating. The ESO's are invited to follow-up the progress in this area, including the necessary cooperation between the relevant public bodies and digital map providers, and to address any standardisation requirements stemming from this action, taking into account the results of previous activities (e.g., the research projects ACTMAP, FEEDMAP and ROSATTE)
 - Public Transport interoperability: The ESOs are invited to complement the existing IOPTA (Interoperable public transport architecture) standard EN 15320 to provide Europe with complete standardised data structures.
 - ITS Framework Architecture: The ESOs are invited to submit proposals for standards to complement and streamline the existing standardisation activities (especially those on Communication Architecture), within the context of the multi-modal European ITS Framework Architecture proposed by the ITS Action Plan.

- **Travel and Traffic Information:** The ESOs are invited to submit proposals for standards related to the definition of common specifications for data and procedures for the provision of EU-wide real-time traffic and travel information services, including those for the free provision of minimum universal traffic information services.
- **Management Services for Traffic and Freight:** The ESOs are invited to submit proposals for standards related to the definition of a set of common procedures and specifications to ensure the continuity of ITS services for passenger and freight in transport corridors and in urban/interurban regions.
- **Open in-vehicle platform architecture:** The ESOs are invited to consider the need of producing standards for the adoption of an open in-vehicle platform architecture for the provision of ITS services and applications, including standard interfaces guaranteeing interoperability/interconnection with infrastructure systems and facilities. The ESO's are invited to follow-up the progress in this area and to address any standardisation requirements stemming from this action, taking into account the results of previous activities (e.g., the research projects CVIS, GST and the eSafety Working Group on SOA).
- **Electric Vehicles (EV):** Within the context of the Green Car initiative, the ESOs are invited to analyse the standardisation needs regarding the introduction of electronic vehicles in Europe. Standardization should cover the use of ICT to assure interoperability of EVs. This shall cover issues such as harmonization of technologies, data and communication protocols, billing and business models, architectures and take into account smart charging in the context of smart grids.
- The ESOs are invited to strengthen international cooperation in the field of ITS, in particular with the USA, with which an implementation agreement exists, but also with other regions.
- The ESOs are invited to analyse the standardisation needs for the development of a safe on-board Human-Machine-Interaction, allowing safe integration and operation of nomadic devices, taking into account the results of the research project AIDE ("Adaptive Integrated Driver vehicle InterfacE") and the conclusions of the Nomadic Device Forum.

The time frame for the required standardisation deliverables

Actions launched under this work programme are expected to be finalised by 2013

Involved Commission services

Lead Services: DG MOVE B4, DG INFSO G4

Contact Person : DG ENTR D4 Emilio Castrillejo

Domain 4: RFID

EU policy area: RFID

Radio frequency identification (RFID) is a technology that uses radio waves to do automatic identification and data capture. The salient features of this technology are that they permit the attachment of a unique identifier and other information – using a micro-chip – to any object, animal or even a person, and to read this information through a wireless device.

RFID is of policy concern because of its potential to become a new motor of growth and jobs, and thus a powerful contributor to the Lisbon Strategy, if the barriers including a lack of interoperability to innovation can be overcome. The production price of RFID tags is now approaching a level that permits wide private and public sector deployment. With wider use, it becomes essential that the implementation of RFID takes place under a legal framework that affords citizens effective safeguards for fundamental values, health, environment, data protection, privacy and security.

The "OECD Policy Guidance on Radio Frequency Identification" was published on the occasion of the OECD Ministerial Meeting on the Future of the Internet Economy that took place in Seoul on 17-18 June 2008. This report contains policy and practical guidance principles to enhance business and consumer benefits from the use of RFID while proactively taking into account information security and privacy issues. It is supported by a report on economic aspects of RFID that reviews major fields of applications, economic impacts and country initiatives, as well as a report that analyses information security and privacy challenges and possible measures and safeguards to address them.

Justification for the standardisation activities

Public consultations and debates carried out in previous years have demonstrated that data protection, privacy and information security aspects of RFID should be carefully assessed and monitored. The standardisation Mandate M/436 was issued on the 8 December 2008 with a view to addressing the above issues as a complement to the existing legal framework.

Domain 5: Electronic signatures

EU policy area: e-signatures
<p>The Directive 1999/93/EC aims at establishing a legal framework for electronic signatures and for certification service providers in the internal market. Several internal market instruments [e.g. Services Directive 2006/123/EC, Public Procurement Directives 2004/17/EC and 2004/18/EC, TVA Directive 2006/112/EC (as far as e-invoicing is concerned)] rely in their functioning on the framework set by the Directive.</p> <p>Interoperable e-signature is also needed to implement a large part of the Multi-annual European e-Justice Action Plan 2009 -2013 (OJ C 75 of 31/3/2009), for example for e-applications for small claims procedures, European Payment Orders, etc., via the European e-Justice Portal implemented by the Commission.</p>
<p>Justification for the standardisation activities</p> <p>Studies carried by the Commission showed that the current multiplicity of standardisation deliverables together with the lack of usage guidelines, the difficulty of access and lack of business orientation is detrimental to the interoperability of e-signatures, and formulated a number of recommendations to mitigate this. Furthermore, the fact that the European e-Signatures Standardisation Initiative (EESSI) ended its activities immediately after the publication of its work did not contribute to the take-up of the existing standardisation deliverables by the industry. Such take-up could possibly have resolved many interoperability issues before they occurred. Furthermore, the Commission evaluated the EESSI process, and recommendations to improve its openness were formulated.</p> <p>Moreover, the Commission adopted in 2008 an Action Plan on e-signatures and e-identification, which contained the following actions relevant for standardisation:</p> <ul style="list-style-type: none">• to update or possibly extend the Commission Decision 2003/511/EC;• to compile a "Trusted List" of qualified certification service providers;• to provide guidance helping to implement e-signature in an interoperable way. <p>Bearing in mind the above elements, the Commission issued the standardisation Mandate M/460 on the 22 December 2009. The objective of this mandate is to update the existing European e-signatures standardisation deliverables in order to create a rationalised framework. Such a rationalisation will also support the realisation of the items of the Action Plan related to e-signature.</p>
<p>Reference documents (EU legislation and/or EU policy documents)</p> <ul style="list-style-type: none">• Directive 1999/93/EC of the European Parliament and the Council of 13.12.1999 on a Community framework for electronic signatures• Commission Decision 2000/709/EC of 6.11.2000 on the minimum criteria to be taken into account by MS when designating bodies in accordance with Article 3(4) of Directive 1999/93/EC of EP and Council on a Community framework for electronic signatures.• Decision 2003/511/EC of 14.7.2003 on the publication of reference numbers of generally recognised standards for electronic signature products in accordance with Directive 1999/93/EC of the European Parliament and of the Council

- **Communication COM(2006) 120** of 15 March 2006 - Report from the Commission to the European Parliament and the Council on the operation of Directive 1999/93/EC on a Community framework for electronic signatures.
- **Communication COM(2008) 798** of 28 November 2008 from the Commission to the Council, the European Parliament, the European Economic and Social Committee and the Committee of the Regions on an **Action Plan** on e-signatures and e-identification to facilitate the provision of cross-border public services in the Single Market.
- Multi-annual European e-Justice Action Plan 2009 -2013 (OJ C 75 of 31/3/2009).
- **Mandate M/279**, 1998, to CEN, CENELEC and ETSI in support of a European legal framework for electronic signatures.
- **Mandate M/290**, 1999, to CEN, CENELEC and ETSI in support of the European legal framework for electronic signatures- Phase 2: Implementation of the work programme resulting from mandate M279 and presented in Section 8.3 of the (draft) report prepared by EESSI.
- **Mandate M/460** of 22 December 2009 to CEN, CENELEC and ETSI in the field of Information and Communication Technologies applied to Electronic Signatures

Required standardisation actions

- The required action is the execution of Mandate M/460. The resulting deliverables will be new/updated standards and Technical Reports covering:
- Inventory of e-signatures standards;
- Rationalised structure for the European e-signatures standardisation documents;
- Gap analysis – assessment of the existing e-signatures standardisation deliverables;
- Quick fixes – identification of actions that must be performed rapidly leading to a quick and easy improvement of the functionality of the existing e-signatures standardisation deliverables;
- Update of CWA 14169:2004, CWA 14167-1:2003, CWA 14167-2:2004 and CWA 14167-4:2004, with a view to quickly update and extension (if necessary) of Decision 2003/511/EC.

The time frame for the required standardisation deliverables

2010 – 2013 . CEN, CENELEC and ETSI shall provide to the Commission, within four months of the acceptance of the mandate, a detailed work programme that sets out the timetable for the work described in the Mandate.

The mandate shall run for a total maximum duration of 48 months from the date of its acceptance.

Domain 6: eInvoicing

EU policy area: eInvoicing
<p>Article 232 of Council Directive 2006/112/EC of 28 November 2006 on the common system of value added tax allows the issue of electronic invoices instead of paper invoices.</p> <p>In order to enhance the use of the digital environment and to reap the full benefits of e-invoicing in the Community, the current practices should be simplified and the transition to new business models facilitated by a more integrated and uniform framework. This would specially serve the interests of European small and medium-sized enterprises (SMEs).</p> <p>The Commission set up at the end of 2007 an Expert Group on e-invoicing in order to address longer-term issues and propose solutions supporting the provision of e-invoicing services in an open and interoperable manner across Europe. The Expert Group delivered its Final Report in November 2009.</p>
Justification for the standardisation activities
<p>The Final Report of the Expert Group on e-Invoicing contains a set of recommendations for further actions in the domain of standardisation (CII = Cross Industry Invoice):</p> <p>R4.9: The EG recommends that the European user community should develop clear profiles and implementation guidelines based on common recommendations facilitated through CEN to support the use of e-invoicing and facilitate interoperability. These implementation guidelines should be made freely available and stored publicly. Until full standards convergence based on these implementation guidelines occurs, the use of choreography specifications and format conversion tools will continue to facilitate mapping between standards.</p> <p>R5.3: The EG recommends to take forward the CII v.2 content standard: including the preparation of a set of European implementation guidelines to be completed as soon as possible and no later than September 2010;</p> <p>R5.4: The EG recommends to further develop the Guidance recommendations for interoperability including questions relating to addressing and identifiers;</p> <p>R5.5: The EG recommends to develop reference implementation models and best practices for standards implementation.</p> <p>R5.6: The EG recommends to formulate and channel specific requirements for the further development of the UN/CEFACT CII v.2 data model.</p> <p>R5.7: The EG recommends to continue the current CEN Workshop and enhance its activities to take account of the Expert Group recommendations.</p> <p>CEN is expected to ensure the implementation of the above recommendations, in coordination with other international organisations (UN/CEFACT, ISO, etc.).</p>
Reference documents
<ul style="list-style-type: none">• Mandate M/339 of 31 October 2003 to CEN, CENELEC and ETSI in support of interoperability of electronic invoicing in the Community.• Council Directive 2006/112/EC of 28 November 2006 on the common system of

value added tax.

- COM(2009) 20 – The technological developments in the field of e-invoicing and measures aimed at further simplifying, modernising and harmonising the VAT invoicing rules.
- COM(2009) 21 – Proposal for a Council Directive amending Directive 2006/112/EC on the common system of value added tax as regards the rules on invoicing.

Required standardisation actions

CEN should develop specific actions, in cooperation with the other ESOs where appropriate, in response to the recommendations of the Expert Group. The actions may result in the publication of CWAs, Technical Reports, and Guidelines.

The time frame for the required standardisation deliverables

CII v.2 Implementation Guidelines should be published in 3Q10.

The other deliverables are expected in the period 2010 – 2012.

Involved Commission Services

Lead Services: DG ENTR D4, DG MARKT H3

Contact Person: DG ENTR D4 Antonio Conte

Domain 7: eSkills and eLearning

EU policy area: eSkills and eLearning
<p>EU efforts to foster the development of ICT related skills and competences (e-skills) as well as the promotion of lifelong learning (including e-learning) require a strong consensus and cooperation among Member States and stakeholders. In this context, pan-European skills and competences frameworks and tools as well as efficient and interoperable e-learning solutions are indispensable.</p> <p>This was reflected in several strategic policy initiatives of the European Commission (e.g. eEurope, i2010 and e-Skills for the 21st Century) and encouraged in the context of the successive research and development framework programmes.</p>
Justification for the standardisation activities
<p>eSkills: the CEN ICT Skills Workshop has been established in 2003. It is contributing to the long-term EU e-skills agenda. Consortium Workshop Agreements have been approved on (1) a European e-Competence Framework which is a reference framework of 32 ICT competences that can be used and understood by ICT user and supply companies, the public sector, educational and social partners across Europe; (2) end-user e-skills framework requirement; (3) practical tool to access e-career services and (4) ICT certification in Europe. Activities starting in March 2010 will concentrate on adapting the European e-Competence Framework to the needs of small enterprises, the development of ICT job profiles and further activities in the field of ICT certification. Future activities (2011-2013) would focus on ICT professionalism, innovation and green ICT skills as well as the international dimension.</p> <p>eLearning: since its start in February 1999, the Learning Technologies Workshop has contributed to the development of standards for learning technologies (e-learning) for Europe. Its goal is also to ensure that European requirements are properly addressed by global initiatives. It is liaising with the CEN Technical Committee 353, which was established in 2007. The benefits of European standards would be an increase in quality of European e-learning products, services and processes and an increase of their interoperability. A number of these Consortium Workshop Agreements are providing good practice for e-learning quality approaches, case studies and implementation guidelines.</p> <p>As the judiciary and legal practitioners are required more and more to use ICT for their everyday work and judicial procedures (especially when e-signature and e-ID/STORK are implemented) pan-European e-skills and interoperable e-learning solutions are essential.</p>
Reference documents
<ul style="list-style-type: none">• COM(2007) 496: “e-Skills in the 21st Century: Fostering Competitiveness, Growth and Jobs” followed by Competitiveness Council Conclusions of 23 November 2007 on a long-term e-skills strategy• COM(2005) 229: "European i2010 strategy for information society and media of 1 June 2005"

- SEC(2008) 2629: "The use of ICT to support innovation and lifelong learning for all - A report on progress" of 9 October 2008"
- COM(2008) 865: "An updated strategic framework for European cooperation in education and training"
- Stockholm Programme 2010-2014 – an open and secure Europe serving and protecting citizens - (Council doc: CO EUR-PREP3 JAI 896 POLGEN 229 of 2.12.2009) setting ambitious targets for training for the judiciary and legal practitioners as well as police, customs officers and border guards.

Important relevant documents are under preparation in the context of the Innovation Act and the European Digital Agenda as well as a report to the Council and the European Parliament on the implementation of the Communication on "e-Skills for the 21st Century".

Required standardisation actions

eSkills: Following the Communication on “e-Skills for the 21st Century: Fostering Competitiveness, Growth and Jobs” of 7 September 2007 which is presenting a long term e-skills strategy for the European Union, CEN is invited to further develop European standards in the field of e-skills with a focus on ICT practitioners, managers and advanced ICT users.

Areas of interest include:

- European e-Competence Framework, Job Profiles, Qualifications and Certifications: methods and tools for the development, the promotion, the acceptance, the implementation and the maintenance and of a European e-Competence Framework and further development with a view to promote ICT professionalism, innovation skills and green ICT skills, including international cooperation;
- European e-Competence Curriculum Guidelines: development, the promotion and the implementation of European e-competences curriculum guidelines to facilitate the mutual recognition of training, transparency of qualifications and credit transfer between formal, non formal and industry education and training.

eLearning: ICT support for education and training is crucial to the objectives of the EU i2010 strategy and the forthcoming European Digital Agenda. The Seventh Framework Programme is continuing the support for use of ICT in education, in particular for innovation. CEN is invited to further develop European standards in the field of e-learning in support of European policies to improve lifelong learning, employability, accessibility and mobility.

Areas of interest include:

- European learner mobility: frameworks for e-learning and lifelong learning standards to ensure European harmonisation, usage and implementation. Focus should be on e-learning opportunities, competence descriptions, learning outcomes, credit points, assessment and e-portfolios.
- eLearning courses, content repositories and exchange mechanisms: focus on metadata, learning design and structure, technical and semantic interoperability supported by agreed protocols, exchange formats and vocabularies. Interoperability should include context-

aware and adaptable e-learning systems.

- eLearning integration: guidelines on how e-learning can be integrated into an organization's infrastructure (school frameworks, enterprise architectures, business and learning processes alignment) including descriptions of e-learning process patterns in key domains (e.g. science and ICT education, SME training and cross-border education).

The time frame for the required standardisation deliverables

2010-2013: CEN shall provide to the Commission in 2010 a detailed work programme for the implementation of the objectives defined in the fields of e-skills and e-learning for the period 2011-2013.

Contact Person: DG ENTR D4 André Richier

Domain 8: ICT for sustainable growth

EU policy area: ICT for sustainable growth

One of the EU's key ambitions is to develop a low-carbon economy. To make this happen, the EU has given policy direction through the comprehensive policy framework proposed in the energy and climate package, including among others the climate and energy targets for 2020:

- A reduction of at least 20% in greenhouse gases (GHG)
- A 20% share of renewable energies in EU energy consumption

Concerning smart grids, the main coordination reference is the Task Force Smart Grids, created to advise the Commission on policy and regulatory directions at European level and to coordinate the first steps towards the implementation of Smart Grids under the provision of the Third Energy Package.

Justification for the standardisation activities

ICTs currently account for around 2% of the total carbon emissions and are expected to triple in the global calculation by 2020 compared to 2002 level. It is therefore urgent that energy efficiency measures are applied in order to counterbalance the expected growth in telecommunications networks.

Smart Grids will also contribute to the increasing use of ICT. The integration of ICT into the centralised grid transforms it into a fully interactive intelligent –"smart"- network. Standard protocols for exchange of information about power demand and supply will allow current to flow exactly where and when it is needed and at the cheapest cost.

Harmonised protocols would provide standard components and interfaces giving 'plug-and-play' capability for any new entrant to the network, such as electric cars, or the use of open architectures based on global communication standards.

The use of Smart Grids for future high-tech infrastructures in Europe, such as integration of renewables and energy infrastructure for electric cars, needs to be addressed from a very beginning to create synergies and assure interoperability.

 - M/451: Power consumption measurement of simple set-top boxes in active and stand-by modes
 - M/455: Common Charging Capability for Mobile Telephones

Required standardisation actions

The Commission will address a standardisation mandate to the ESOs inviting them, in a first phase, to identify the potential role of standardisation in support of the realisation of the policy objectives. The ESOs are invited to contribute to the establishment of a successful mandate.

The ESOs are requested to support the Task Force Smart Grids to produce a report concerning the standards issues relating to smart grid – which organizations are working on the issue at global and regional level, what are their timeframes, what mechanisms exist for collaboration between them, what gaps there may be. The report should be prepared in consultation with the Smart Grids European Technology Platform, the Smart Grids Forum and the European Electricity Grids Initiative (EEGI) and take due account of other international initiatives.

Furthermore, the ESOs are invited to focus in their proposals to link standardisation and research into novel ICT-based solutions to increase energy efficiency and strengthen their take-up.

The time frame for the required standardisation deliverables

Actions launched under this work programme are expected to be finalised by 2013

Domain 9: Internet of Things

<p style="text-align: center;">EU policy area: Internet of Things</p>
<p>The policy area addressed is the Internet of Things (IoT). The concept refers to billions of objects that connect transparently to the Internet to retrieve or send information to a distant database or information system without direct human intervention. From a pure technical point of view, the IoT is therefore an extension of the naming system of the Internet. As it enables the identification of electronic data elements (e.g., URL address for websites), the IoT means a convergence of electronic ID. Moreover, the IoT is not restricted to a specific technology but covers several technical solutions (RFID, TCP/IP, sensors, actuators, interfaces, and more generally mobile technologies which are capable of object identification, data capture, storage, processing, transfer within physical environments as well as between physical contexts and virtual universes). Potential related applications include smart grids and e-Health.</p>
<p>Justification for the standardisation activities</p>
<p>The European Commission released in 2009 a communication the Internet of Things" with a defined set of activities. This includes as Action Line 6 the setting up of an IoT Standardisation Mandate. Today's networks comprise complex ecosystems of vendors whose products are not always interoperable. In a longer-term perspective, smooth and effective functioning of the IoT will require development of and wide consensus about standards for physical interconnection, protocols, data structures, and distributed architectures. A standard for network architecture is crucially required for the upcoming IoT. As its first level refers to the open loop scenario, in supply chain optimisation, standardisation within the same value chain is a minimum requirement. Special emphasis may need to be laid on the governance of the IoT: decentralised ONS (i.e. the discovery of object information on the basis of an electronic product code), Discovery Services (i.e. information searches within the network such as RFID "events" associated to a product) and on the "silence of the chips".</p>
<p>Reference documents</p>

Domain 10: ePublishing

EU policy area: ePublishing
Justification for the standardisation activities
<p>Book publishing is the largest cultural industry in Europe with a 23 billion annual turnover and a production of more than half a million new titles each year.</p> <p>Publishers are increasingly impacted by the electronic environment, not only in the production of their books but also by consumers' expectations to be able to access books on any device or any platform they may choose. Interoperability is key to allowing the consistent use of different devices and platforms and allow consumer choice. Standards are a critical means to achieve interoperability and are therefore an important potential tool for the publishing industry.</p> <p>There are a number of specific standards issues such as publishing workflow and production software, metadata standards, distribution and end-user requirements. But an accepted overview of these developments is lacking, and there are a number of serious pending problems concerning, for example, interoperability of e-book formats.</p> <p>The ESOs should seek to provide such an overview and identify specific difficulties to be resolved by the standards process, whether by formal bodies or involved consortia.</p>

Domain 11: eIdM, privacy and security

EU policy area: eIDM, privacy and security
<ul style="list-style-type: none">- Electronic Identity Management in the Information Society- Cyber-security of industrial control systems
Justification for the standardisation activities
<p><u>Electronic Identity Management in the Information Society</u></p> <p>The number and complexity of digital transactions in e-commerce, e-government, in the Cloud, across service domains, across countries and jurisdictions are in full expansion. The EU Member States and many other countries are in the process of developing electronic identity documents, such as e-Identity, e-Drivers Licence, eHealth etc cards and are facing issues related to security, interoperability, usability, identity theft, privacy protection, safer Internet use and many others. The rapid proliferation of the use of the Internet has led to industry taking initiatives to facilitate secure access to services, leading to similar concerns as those governments are faced with. With the proliferation of digital interactions and transactions various forms of abuse are on their way up, and the need for secure applications and law enforcement is increasing.</p> <p>In recent years a variety of technologies that could support digital identity management and authentication or access control have reached maturity, and the wider concept of Identity in the digital age has been deeply explored and described. Applicable technologies range from specific enabling technologies such as cryptography, biometrics, and secure communication protocols to entire frameworks for electronic identity management. Considering these developments, - in many different areas and by many different actors - efforts to establish standards cannot stay behind. As several initiatives in identity standardisation are already ongoing and others are being prepared or discussed, a wider systemic approach is urgently needed.</p> <p>There is a need to establish an overall frame for electronic identity management within the context of the evolving Information Society and digital economy. Any eIdM frame has to comply with relevant European legislation (ref. data protection, ePrivacy, electronic signature and others). To ensure wide applicability and effectiveness, standards should support interoperability across different platforms, networks and service domains, across application and device categories, and should serve government, public authorities, business and citizens alike. With a view of the evolving Information Society, standards should be applicable to future developments to the widest possible extent, and should cover natural and legal persons, and entities.</p> <p>Privacy protection and user centrality, in the sense of giving the user decisive control over the release and use of her/his identity attributes, are central concepts. Important boundary conditions for standardisation work in eIdM are minimal data disclosure, data proportionality and multilateral security for the stakeholders involved in eIDs. Standards should address the full spectrum of identity attributes in the digital age, ranging from anonymity to full identification, as well as indirect identification, such as through profiling.</p>

eIdM standards should cater for security, for robustness against identity theft and revocability when identity credentials are compromised, and allow efficient re-establishment of compromised identity credentials. Furthermore they should allow the use of eID credentials for secure authentication and authorisation, for accountability and audit purposes, enabling remedial action and provide elements for assigning responsibilities in the context of liabilities.

Finally, any new standardisation initiative should take stock of on-going activities, as follows:

Secure Identity Across Borders Linked - STORK (<https://www.eid-stork.eu>)

Future of Identity in the Information Society - FIDIS (<http://www.fidis.net>)

Privacy and Identity Management for Europe - PRIME (<https://www.prime-project.eu>)

Cyber-security of industrial control systems

Supervisory Controls and Data Acquisition (SCADA) is the term for security of process control and industrial manufacturing systems. These have increasingly relied on commercial information technologies, but the number of user groups and standardisation activities dealing with security issues in the area of SCADA systems has rapidly grown over the last few years. On the one hand this is a good message, because it underpins that security has become an important issue being taken into account. On the other hand it leads to a jungle of standards and guidelines, because these are often being developed in parallel, with resulting lack of interoperability and other conflicts.

The FP7 ESCoRTS project ("European Network for the Security of Control and Real-Time Systems") has provided an overview of the relevant standards and guidelines. This work should be taken forward in order to provide interoperability specifications and implementation guidance.

Required standardisation actions

Electronic Identity Management in the Information Society

Common specifications for interoperable electronic identity management will have to be addressed as follow-up of the STORK project (most probably in 2011) and in coordination with policy actions to be set by the Commission in 2010 in support of a digital society.

Precise definition need to be worked out in the standardisation groups. The definition of a standardisation mandate would probably be part of the work.

Cyber-security of industrial control systems

In collaboration with interested stakeholders, the ESOs are invited to prepare a programme for the production of the relevant interoperability specifications and related guidance. The programme should be prepared in full collaboration with the relevant TCs in ISO and IEC and with consortia activities as cited in the ESCoRTS overview, and recommend timescales.

The time frame for the required standardisation deliverables

Electronic Identity Management in the Information Society

Given the work being done currently in DG INFSO to come to a European Large Scale Action for developing a framework for interoperable and privacy protecting e-Id management in the EU, clear planning in line with the development of this action is required.

Cyber-security of industrial control systems

12 months.

Domain 12: eBusiness

EU policy area: eBusiness
<ul style="list-style-type: none">- e-Procurement- Classification systems for public procurement- Standardisation of e-tools in the field of e-procurement (e.g. e-catalogues, e-attestations, etc.)- Electronic communication of business and financial data
Justification for the standardisation activities
<p>There is a need to eliminate / prevent interoperability barriers to the participation in electronic public procurement procedures, in particular across borders, and to facilitate and accelerate the effective usage of electronic public procurement procedures and tools. Most standardisation work is ongoing in the post-award area and quite advanced in this domain, so no new standardisation efforts are required for the time being. The pre-award area still requires some standardisation work related to information exchange related to tendering qualifications.</p> <p>As far as business and financial data are concerned, the use of the "eXtensible Business Reporting Language" (XBRL) is emerging. It is a language for the reporting of business and financial data that provides major benefits in the preparation, analysis and communication of business information. It offers cost savings, greater efficiency and improved accuracy and reliability to all those involved in supplying or using financial data. It belongs to the family of "XML" languages.</p> <p>It is being developed by an international non-profit consortium of approximately 450 major companies, organisations and government agencies. It is free of licence fees. There are already several implementations based on XBRL, and their number is growing rapidly. More information is available at www.xbrl.org and http://en.wikipedia.org/wiki/XBRL .</p> <p>XBRL could be of interest to the eBSN members and to DG ENTR/B5 who is in charge of the administrative simplification. XBRL has been widely accepted as a way of recording, storing and transmitting business financial information, and has the potential to deliver major cost savings and gains in efficiency, improving processes in companies, governments and other organisations.</p> <p>The introduction of XBRL tags enables automated processing of business information by computer software, cutting out laborious and costly processes of manual re-entry and comparison. Computers can treat XBRL data "intelligently": they can recognise the information in a XBRL document, select it, analyse it, store it, exchange it with other computers and present it automatically in a variety of ways for users. XBRL greatly increases the speed of handling of financial data, reduces the chance of error and permits automatic checking of information.</p> <p>Conversion of some basic XBRL Recommendations into European standardization</p>

deliverables, with appropriate cross-referencing, will help improve the acceptance of the specification across Europe, and enable improvements to be made.

- Forthcoming results of the evaluation of the e-procurement action plan, in view of drafting a new strategy document for 2010-15

XBRL:

- The announcement of the European Parliament from 10 March 2009 (<http://www.europarl.europa.eu/sides/getDoc.do?type=TA&language=EN&reference=P6-TA-2009-0100>):
- [The European Parliament] “calls on the Commission to stimulate simplification and harmonisation of company law and, in particular, accounting rules within the internal market in order to reduce the administrative burden for SMEs and increase the transparency for all relevant stakeholders; urges the Commission to promote strongly the use of new technology such as eXtensible Business Reporting Language (XBRL) by presenting a roadmap for introducing XBRL reporting in the European Union with a view to making it mandatory within a reasonable time frame and to promote and support wide use of this open standard;”

Required standardisation actions

e-Procurement:

- Classification systems, convergence between different classification systems (CPV, eCI@ss, gpc/gsl, etc.), electronic catalogues and their use in procurement phases (e-tendering, e-ordering). In particular, work covering the following issues:
 - possible synergies between eCI@ss, CPV and other classifications.
 - product data interoperability through reference data libraries.
 - activities aimed at the adoption of Product Data standards by SMEs
- Definition of standard formats, messages and data exchange for various e-procurement phases and tools
 - Continuation of the work on technical, semantic, organisational and legal interoperability in the field of public procurement, follow-up to the results of the CEN Workshop BII with focus on their implementation and on a sustainable governance model.
- Definition of standard formats for certificates and attestations issued by public offices to provide evidence to third parties of status, situations, events, etc., concerning individuals and businesses.
- Multilingualism in ICT (e.g. for classification systems, standard forms, certificates and attestations...)
- Promotion and awareness activities (conferences, events) on the above topics

XBRL:

The activity should be undertaken in full collaboration with XBRL.ORG, and take due account of other relevant international standards activities (e.g. UN/CEFACT).

The outcome is expected to be constituted by Technical Reports, CWAs, and guidelines.

The time frame for the required standardisation deliverables

Ongoing activities in the period 2010 -2012.

Lead Services: DG MARKT C4 (e-procurement), DG ENTR B5 (XBRL)

Contact Person: DG ENTR D4 Antonio Conte

Domain 13: eGovernment

EU policy area: eGovernment

eGovernment is about using the tools and systems made possible by Information and Communication Technologies (ICT) to provide better public services to citizens and businesses. Such technologies are already widely used by government bodies, just as in enterprises, but eGovernment involves much more than just the tools. Effective eGovernment also involves rethinking organisations and processes, and changing behaviour so that public services are delivered more efficiently to the people who need to use them. Implemented well, eGovernment enables all citizens, enterprises and organisations to carry out their business with government more easily, more quickly and at lower cost.

In the European Union's internal market, people are able to move freely – either for work or for private reasons – and consequently they have to be able to deal with public services outside their home country more and more. If eGovernment services are to provide significant added value to citizens and business, then it is crucial that different government bodies, both within a country and in different EU Member States, are able to share information easily and co-operate in serving citizens. Therefore, public services are getting more and more a pan-European character.

In order to share information easily and to co-operate, government bodies need to ensure interoperability between legal environments, organisational structures, and underlying information systems (both at the semantic level – what is the meaning of the information that is exchanged – and at the technical level). Whenever possible, interoperability should be based on standards.

Justification for the standardisation activities

While standardisation at the technical level can best be left to industry, governments should be main stakeholders in eGovernment standardisation attempts at the higher levels (semantical, organisational, legal).

It is not certain that the traditional standardisation methods and processes, used today for standardisation in the area of ICT, are adequate for this new domain.

Regarding the need for specific standardisation work in the domain, a first case is constituted by the European Case Law Identifier (ECLI), that has strong links to the European e-Justice Portal. Other domains of this Work Programme include specific actions for e-ID, e-signatures, e-learning and e-skills that are related to e-Justice too.

Required standardisation actions

- The ESOs are invited to propose initiatives related to:
 - The creation of an effective process ensuring a wide participation of government bodies in standardisation activities related to eGovernment.
 - Ensuring effective dissemination of relevant standards towards government bodies and towards those involved in constructing ICT systems supporting eGovernment
 - Supporting the spread of best practices in this area.
 - Support the implementation of the European Case Law Identifier (ECLI)

The time frame for the required standardisation deliverables

2010 - 2013

Contact Person: DG ENTR D4 Antonio Conte

Domain 14: Support to implementation of standards

EU policy area: Support to implementation of standards
<p>Standardisation is one important way to widespread the application of research results under the condition that it is part of an overall approach to encouraging innovation through market uptake and commercialisation of innovating technologies, the dissemination of scientific results and the development of common specifications and standards.</p> <p>In addition, the recommendations in the communication from the Commission “Towards an increased contribution from standardisation to innovation in Europe”, refer, inter alia, to:</p> <ul style="list-style-type: none">- the inclusion of new knowledge in standards resulting from publicly funded research and innovation programmes- the need to involve SMEs in European standardization.
Justification for the standardisation activities
<p>Initiatives to better link ICT standardisation and ICT R&D appear to be most effective when carried out already at the research planning stage. Standardisation awareness thus needs to be considered early in the research life cycle.</p> <p>Furthermore, a failure to support innovative SMEs in the ICT industry in their efforts to influence standards could seriously restrict the market impact of these SMEs, and their long-term growth prospects.</p>

Required standardisation actions
<ul style="list-style-type: none">• The ESOs are invited to propose standardisation related initiatives to further support the effective take up and implementation of standards in the priority domains identified by the Work Programme. These actions should cover:<ul style="list-style-type: none">- awareness, promotion, conferences, information and education, paying particular attention to the cooperation with R&D and SMEs involvement.- implementation of pilot projects and interoperability testing.
The time frame for the required standardisation deliverables
Actions launched under this work programme are expected to be finalised by 2011
Involved Commission services

Time schedule for the launch of the 2010-2013 ICT standardisation work programme

<u>Date</u>	<u>Action</u>
27/01/2010	Transmission to services with request for comments by 29/01
29/01	Transmission to ESO with invitation for meeting 16/02 WP also to be submitted to Industry, consumer, SME ; organisations ; to the ICT/SC with request for comments
24 /02	Meeting with ESO's : presentation and discussion WP, financial rules, submission process for proposals etc; invitation for comments by 26/02
26/02	Deadline comments
March	Information Committee 98/34
March	Invitation submission of proposals; Although the WP covers a 3 years period, a first batch should however be submitted by end of May in view of signed contracts before end of the year. Further submissions are possible and can be processed as soon as budget availability is guaranteed.
29/04	Presentation and discussion WP with ICT/SC
End May	Start of evaluation of proposals
June - end of July	First evaluation round, subsequent info to ESO's with potential request for updating the proposals
September	Interim Information report to Committee 98/34 on status of proposals received
September – Mid October	Second evaluation round
End October 2010	Finalisation first batch of proposals
